Readers may now listen to AJHP podcasts that feature brief interviews with authors of upcoming AJHP articles. Each podcast is 10–15 minutes long and provides additional details about the authors’ work and its implications on practice. Readers may listen to these podcasts as streaming audio at www.ajhp.org or subscribe to them through iTunes. Feedback or comments regarding this service can be sent to the Journal’s editorial staff at ajhp@ashp.org. Articles with podcasts will be identified with the icon on the title page.

OF SPECIAL INTEREST

Impact of a Pharmacist-Directed Intervention in Postmenopausal Women After Fracture
Clinical pharmacy specialists at primary care clinics and skilled-nursing facilities were more successful than a centrally located nurse in getting osteoporosis pharmacotherapies started in postmenopausal women with a recent fracture.

Preventing Venous Thromboembolism in Hospitalized Patients With Cancer: Improving Compliance With Clinical Practice Guidelines
Guidelines from three authoritative groups recommend that hospitalized patients with cancer receive unfractionated heparin, a low-molecular-weight heparin, or fondaparinux to prevent venous thromboembolism, unless there is a contraindication to such therapy.

The Role of Mucoregulatory Agents After Continent-Preserving Urinary Diversion Surgery
Continent-preserving urinary diversion surgery, while saving patients from constant drainage into a urostomy appliance, increases their risk for mucus-related complications. Urine-pouch instillations of N-acetylcysteine or a urea solution, oral therapy with ranitidine or aspirin, or subcutaneous injections of octreotide have reportedly helped some patients.
